

MTA AUDIO EDITOR

THE PROFESSIONAL DAW WITH MTA SUPPORT

A real Digital Audio Workstation for editing, mixing, mastering and multitrack production, with full native support for MTA files.

KEY FEATURES

Multitrack DAW projects
Unrestricted multitrack editing and production workflows.

MTA8 / MTA16 support
Native import, editing, mapping and export.

Import audio
MTA, WAV, MP3 and FLAC.

Project export
Export to MTA, WAV, MP3 and FLAC.

Single-track export
Save individual tracks separately.

Live mixer and FX
Volume, pan, mute/solo, meters and plugins.

Plugins and presets
Factory/custom presets with immediate controls.

Waveform and timeline
Precise editing, markers, Follow and synchronized playback.

Lyrics / chords / metadata
Timed content and project metadata management.

Click / Melody mapping
Device-aware MTA track placement.

Desktop, Web, Mobile
Native desktop plus browser, Android and iOS.

Stem separation
Optional Demucs-powered separation.

SUMMARY TABLE

Editing	Cut, trim, fade, markers, timeline, waveform.
Project format	Multitrack DAW projects with MTA support.
Formats	MTA, WAV, MP3, FLAC; project and single-track export.
Mixer & FX	Volume, pan, mute/solo, effects, plugins and presets.
MTA	MTA8 / MTA16 import, mapping, metadata and export.
Platforms	Windows, macOS, Linux, Android and iOS.

Windows

macOS

Linux

Android

iOS

Built for professionals who work with multitrack audio and MTA files.

Operational details and working modes

How MTA Audio Editor works on desktop, web and mobile, which resources it uses, and which limits to consider.

Project modes

- Multitrack DAW: editing and mixing without the MTA 8/16-slot limit.
- MTA8/MTA16: export targets with physical mapping and device profiles.

Playback

- Dynamic mode: pre-buffering, synchronized start and drift correction.
- Render mode: rendered master with Follow and VU meters; automatic refresh when required.

Desktop / Web / Mobile

- Native single-user desktop: no mandatory local account.
- Online server and mobile: users, email, roles and TOTP; heavy processing is server-side.
- Mobile apps use the preconfigured server; the default URL is never displayed.

Audio and processing

- WAV, MP3, FLAC and MTA; project and single-track export.
- Optional Demucs stem separation requires significant server resources.
- Up to 16 insert FX per track/master, with factory and user presets.

OPERATIONAL LIMITS

MTA8	8 physical output slots; extra tracks must be mapped/merged.
MTA16	16 physical slots; corpus default Click 1, Melody 9; editable.
Server upload	1024 MB by default; configurable in Docker/Kubemetes.
Insert FX	Up to 16 inserts per track/master chain.
Demucs	High CPU/GPU/RAM usage; processing time depends on the server.
MTA hardware	Validate exports on target device/firmware before live use.
Browser/mobile	Heavy functions depend on the backend and HTTPS connectivity.
Storage	Originals, renders, waveforms and attachments use persistent storage.

MTA export and compatibility

MTA keeps track roles, streams and timed data separately addressable. MTA8 profiles place Click/Melody according to the target device; MTA16 proposes Click=1 and Melody=9 from the available corpus. Silent intermediate slots are created when a physical position must be preserved. Final compatibility depends on target device and firmware.
